## 5.4 Attentions

- A. The module would automatically turn on the sensor LED when execute Enroll, Enroll One Time, Identify, Verify, Enroll And Store in RAM, Get Feature Data of Captured FP, Verify Downloaded Feature with Captured FP, Identify Downloaded Feature with Captured FP. If get the correct fingerprint, LED would be off; unless the LED would keep on. User can control the LED on or off according to their demand. It is also available for adopting Sensor LED Control command to control the LED on or off.
- B. This module features device password function. Once set the password, all the commands are unavailable without password authentication. So it can protect the enrolled FP data as anti-theft function with high security. If not set password, all the commands can be available without password.
